
HOW DOES THE VIRUS SPREAD?

The virus spreads from person-to-person between people in close contact with one another (within about 6 feet).

Respiratory droplets produced when an infected person coughs, sneezes or talks can land on people who are nearby or possibly can be inhaled into the lungs.

COVID-19 may be spread by people who are not showing symptoms and may live on and be spread by touching surfaces.

You can help stop the spread of the virus:

as much
as possible

between yourself
and others
